ABSTRACT

A printer is disclosed which automatically unifies the

layout of output to each of mail bins. This printer sets the

layout for each of the discharged paper trays (mail bins).

5   The information of layout designated by a personal computer

is invalidated when the layout has been set for the mail bins

designated by an external personal computer. By storing in

a memory the image data edited in the layout to be produced

when the supply of papers has run out, the printer permits

10 effective use of the memory and a reduction in the time of

output.
